Patent No. 6140583
GENERAL INFORMATION:
APPLICAMT: YAN, Chunhua et al.
TITLE OF INVENTION: ACID MOLECULES ENCODING HUMAN KINASE PROTEINS, AND USES
TITLE OF INVENTION: THEREOF ENCODING HUMAN KINASE PROTEINS, AND USES
TITLE OF INVENTION: THEREOF ENCODING HUMAN KINASE PROTEINS, AND USES
TITLE REFERENCE: CL001178
CURRENT APPLICATION NUMBER: US/09/813,817
CURRENT FILING DATE: 2001-03-22
NUMBER OF SEQ ID NOS: 4
CURRENT FILING DATE: 2001-03-22
NUMBER OF SEQ ID NOS: 4
LENGTH: 59065

Sequence 1, Application US/08688145

Patent No. 5744310

GENERAL INFORMATION:

APPLICANT: Reed, John C.

TITLE OF INVENTION: Assays for Identifying Agents that Regulate BAX Gene
TITLE OF INVENTION: Expression

NUMBER OF SEQUENCES: 20

CORRESPONDENCE ADDRESS:

                                                                                                                                                                                                                                                                                                ò
                                                                                                                                                                                                                                                                                                                                                                                                     The present sequence is human activation-induced cytidine deaminase
(AID). AID structurally relates to an RNA editing enzyme APOBEC-1 and
has cytidine activity similar to APOBEC-1. AID has antiallergic,
antiantanetic, antiasthmatic, ophthalmological, anti-HIV and
dermatological activities, and can be used in gene therapy. AID
collidar activities, and can be used in gene therapy. AID
polynucleotides are useful in methods for identifying drugs for the
treatment of B cell associated immune system disorders, immunodeficiency
disease and allergies, such as immunoglobulin A (19A) deficiency
disease, 1gA nephritis, gamma-globulinaemia, atopic dermatitis, allergic
collita, asthma, food allergy, drug allergy, allergic rhinitis, Rosen
disease, DiGeorge disease, ataxia telangiectasia, common variable
immunodeficiency disorder, MHC (major histocompatibility class) class
II deficiency disease, AIDS (auto immunodeficiency syndrome), elevated
19E disorder, and 19G subclass selection disorder. The DNA sequences
encoding AID may be used for gene therapy and the antibodies to the AID
protein may be used for gene therapy and these disorders.

       antianemnic, antiasthmatic, ophthalmological, anti-first definition antianemnic, and can be used in gene therapy. AlD polynucleotides are useful in methods for identifying drugs for the treatment of B cell associated immune system disorders, immunodeficiency diseases and allergies, such as immunoglobulin A (1gA) deficiency disease. IgA nephritis, gamma-globulinaemia, atopic dermatitis, allergic colitis, asthma, food allergy, drug allergy, allergic rhinitis, Rosen disease, bidecorge disease, ataxia telangiectasia, common variable immunodeficiency disease, ALDS (auto immunodeficiency syndrome), elevated IgE disorder, and IgG subclass selection disorder. The DNA sequences encoding ALD may be used for gene therapy and the antibodies to the ALD protein may be used for diagnosis and treatment of these disorders.

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The cand gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynuclectide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations of sequences. ABG00010-ABG30377 represent novel human amino acid sequences of data and products dependent on DNA and amino acid sequences of the invention.

Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at fire wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           2067
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               2066 GATCTCAGCTTACTGCAACCTCCACCTCCTGGGTTCAAGCGATTCTCCTGCCTCAGCCTC 2007

Thremiton also fatates to vectors and recombinant heat cells comprising a nucleotide of the invention, methods of producing the novel polypeptides, and methods of detecting the novel polypeptides of the invention. Although novel, many of the polypeptides of the invention have homology to known proteins, thereby bind to polypeptides of the invention have homology to known proteins, thereby giving an insight into their probable biological activities, and hence the everyone proteins and proteins and hence of internation activities; and hence of inferentiation activities; and record activities; and hence of immunomodulatory activity; activit or inhibhr-related activities; creeptor or ligand activities; neceptor or ligand activities; creeptor or ligand activities; creating or metastasis.

Conditions, e.g., by protein or gene therapy. Such conditions include creates and activities and model activities and activities and model activities and activities and activities or an ensetil if or preventing, with tissue regeneration and createstal ischematic protein or gene therapy. Such conditions include createstal ischematicy activities and ulaced or immunomodulatory activities may be used to promote wound the allowed activities may be used to activity activities may be used in the treatment of viral, immunomodulatory activities may be used in the treatment of viral, and proven the activities may be used in the treatment of viral, and proven the activities may be used in the treatment of viral, and proven colls in culture to give rise to neuroepital and fungal infections in addition to immune disease or accidental damage. The above conditions, and indrugence a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          1962
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    the presence of or predisposition to, or preventing or treating pathological conditions associated with an ORFX associated disorder. The nucleic acids can be used to express ORFX proteins in gene therapy vectors. The proteins and nucleic acids may be used to treat cancers, proliferative disorders, neurodegenerative disorders, osteoarthritis, proliferative disorders, neurodegenerative disorders, osteoarthritis, hypothreoids, neurodegenerative disorders, osteoarthritis, hypertension, hypothyroidism, cholesterol ester storage, systemic lupus bacterial or fungal infection, malaria, autoimmune disorders, asthma, allergies, aplastic anaemia, burns, wounds, bone and cartilage damage, nocturnal haemoglobinuria, antinflammatory disease; to enhance coagulation; to inhibit thrombosis; and as a contraceptive.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          40

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to novel human secreted proteins, the nucleic acids encoding them. The protein may exhibit cytokine, cell proliferation or cell differentiation activity or may induce production of other cytokines in certain cell populations and may exhibit immune stimulating

                                                                                                                                                                                                                                                                                                                                                                 g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The PNs and proteins of the invention are predicted to have biological activities which would make them suitable for treating, preventing or analyzating medical conditions in humans and animals, although no supporting medical conditions in humans and animals, although no supporting data is given. Suggested activities include nutritional activity, cytokine and cell proliferation/differentiation activity, in mematopolesis regulating activity, chemotectic/chemokinetic activity, hemostatic and thrombolytic activity, chemotectic/chemokinetic activity, and tumor inhibition activity. The PNs are also stated to be useful for gene therapy. Other activities include inhibiting the growth, infection or inhibition activity. The PNs are also stated to be useful for gene therapy. Other activities include inhibiting the growth, infection or function of bacteria, fungi, viruses and other parasites; effecting bodily characteristics such as, e.g. weight, color, skin, etc., effecting biorhythms or caricadic cycles; enhancing fertility; treatment of pain; hormonal or endocrine activity.

munodeficiency (SCID), autoimmune disorders e.g. multiple sclerosis, systemic lupus erythematosus, rheumatid arthritis, autoimmune pulmonary inflammation. The proteins are also useful in the treatment of diseases and disorders including tissue, skin and organ transplantation and in graft-versus-host diseases (GVHD), in the induction of tumour immunity, myeloid or lymphoid cell deficiencies, wound healing and tissue repair, in the treatment of burns, incisions and ulcers; as well as in treatment of purns, incisions and ulcers; as well as in treatment of purns, incisions and ulcers; as well as in treatment of purns, incisions or osteoarthritis, mediated by in the treatment of purns, incisions or osteoarthritis, mediated by alzheimer's parkinson's diseases of the peripheral nervous system, anylotrophic lateral sclerosis, and SNy-Drager syndrome, infections, infantantory bowel disease, ulcers, bone regeneration. The protein, having activin or inhibin-related activities is useful as a contraceptive based on the ability of inhibins to decrease fertility in femmals and decrease spermatogenesis in male mammals. The proteins and nucleic acids are also useful as food supplements. The proteins and nucleic acids are also useful as food supplements. The present sequence represents a secreted protein of the invention.

clones bd306-7 and yb8-1 respectively and the clones bd306-7 and yb8-1 are deposited with the American Type Culture Collection (ATCC) with a cession number 98599. The polynucleotides and encoded polypeptides have cytostatic, anti-inflammatory, immunomodulator, vulnerary, neuroprotective, activin, inhibin, chemotactic, haemostatic, thrombolytic and anti-inflammatory activity and acting as cytokine modulators. Commantopoiesis regulators, tissue growth modulators and/or canderin suppressors. The polypeptides and polynucleotides are useful in gene therapies, particularly for preventing, treating or ameliorating any of therapies, particularly for preventing, treating or ameliorating any of the following diseases: immune deficiency and disorders; e.g. bacterial or fungal infections, autoimmune disorders, cancer, systemic lupus crythematosus or graft-versus-host disease, myeloid or lymphoid cell or tythematosus or graft-versus-host disease, myeloid or lymphoid cell caterial and peripheral nervous system diseases and corropathies, e.g. Alzheimer's, Parkinson's disease, Huntington's cardiac infarction or stroke; inflammations, shork, sepsis or systemic inflammatory response syndrome, ischaemia-reperfusion cryohic confinium; and infarmiatory arthritis, inflammatory bowel disease or colon's disease, or tumours or cancers, pemphigus vulgaris or pemphigus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     364
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          CACGTGGAATTGCTCTTCCTCCGCTACATCTCGGACTGGGACCTAGACCCTGGCCGCTGC 304

amino acid sequences given in AAM8110 to AAM91921. (I) have cytostatic activity, and can be used in gene therapy and vaccine production. (I) crostains and polynucleotides may be used in the prevention. (I) treatment of diseases associated with inappropriate (I) expression. For example, they may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of (I) by expressing inactive proteins or to supplement the patients own production of (I). Additionally, (I) polynucleotides may be used to produce the secreted (I), by inserting polynucleotides may be used to produce the secreted (I), by inserting the racial into a host cell and culturing the cell to express the protein. (I) proteins and polynucleotides may be used to prevent, diagnose and treat immune/haematopoietic-derived cells. AAK64703 to AAK87694 represent human immune/haematopoietic antigen genomic sequences from the present invention. AAK84942 to AAK87695 and AAM82169 represent invention. AAK84942 to AAK87695 and AAM82169
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           1832 CCGGGCGTGGTGGCTCACGCCTGTAATCCCAGCACTTTGGGAGGCCGAGCCGGGCGGATC 1891

The expression of RNA-associated proteins is closely associated with reproductive tissues, nervous tissues, cell proliferation including cancer, inflammation and immune responses, and so they may be used for diagnosis, treatment or prevention of cell proliferative, and immune/fiftlammatory disorders, and reproductive disorders. Diseases and disorders which may be treated include actinic keratosis, atherosclerosis, arteriosclerosis, bursitis, cirrhosis, hepatitis, mixed connective tissue disease, myelofibrosis, paroxysomal nocturnal hemoglobinuria, polycythermia vera, psoriasis, primary thrombocythemia

Sequences ABB10981-ABB12330 represent 1350 novel human polypeptides, and sequences ABA08225-ABA09574 represent nucleic acids encoding them. The invention also relates to vectors and recombinant host cells comprising a nucleotide of the invention, methods of producing the novel polypeptides, and methods of detecting the nucleotides, antibodies against the polypeptides, methods of identifying compounds which bind to polypeptides of the invention have homology to known proteins, thereby yolypeptides of the invention have homology to known proteins, thereby yolypeptides of the invention have homology to known proteins, thereby yolying an insight into their probable biological activities, and hence potential therapeutic applications. The polypeptides of the invention may have various activities, including cytokine, cell proliferation or cell differentiation activities; stem cell growth factor activity; manunomodulatory activity; activit or inhibin-related activities; chemotactic or chemokinetic activities; haemostatic, thrombotic or
                                               Human; cytokine; cell proliferation; cell differentiation; growth factor; haematopolesis regulation; tissue growth; immunomodulator; activin; inhibin; chemotaxis; chemokinesis; thrombolysis; oncogenesis; proliferation; metastasis; cancer; tumour; haematopoietic disorder; myeloid cell disorder; lymphoid cell disorder; asthma; arthritis; chronic inflammatory condition; proliferative retinopathy; atherosclerosis; coronary heart disease; arterial ischaemia;

                                                                                                                                                                                                                                                                                    ABB12093
                                                                                                                                                                                                  g
                                                                                                                                                                                                                                                                                                                                       The interaction retails to the polypeptides are useful for determining the presence of or predisposition to a disease associated with altered levels of polypeptide. The polypeptides are also useful for determining the presence of or predisposition to a disease associated with altered levels of polypeptide. The polypeptides are also useful for identifying agents (agonists and antagonists) that bind to them. Cells expressing the proteins are useful for identifying a therapeutic agent for use in treatment of a pathology related to aberrant expression or physiological interactions of the polypeptides we certors comprising the nucleic acids encoding the polypeptides and cells genetically engineered to express them are also useful for producing the proteins. The proteins are useful in genetic vaccination, testing and the proteins are useful in genetic vaccination, testing and the proteins are useful in advormants. They may be used to increase stem cell proliferation; to regulate haematopoiesis; and in bone, cartilage, tendon and/or nerve tissue growth or regeneration; immune suppression and/or stimulation; as anti-inflammatory agents; and in treatment of leukaemias. AAUS9510-AAU33304 represent the amino acid. In treatment of leukaemias. AAUS9510-AAU33304 represent the amino acid.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             TITITITITITITITICIGAGACAGAGICITGCICCIGGGCGCGGGGGGGAGCGC 2070

conditionablytic activities; receptor or ligand activities; or may be conditionablytic activities; receptor or ligand activities; or may be conditionary and incogenesis, cancer cell proliferation or metastasis. The livention are useful for preventing, treating or ameliorating medical conditions, e.g., by protein or gene therapy. Such conditions include disorders, haematopoletic disorders (e.g., myebloid or lymphoid cell cancers), haematopoletic disorders (e.g., myebloid or lymphoid cell disorders), chronic inflammatory conditions (e.g., asthma or arthritis), proliferative retinopathy, atherosclerosis, coronary heart disease, vascular growth. Polypeptides involved with tissue regeneration and repair (or nucleic acids encoding them) may be used to promote wound conditions and ulcers), while those with communication and ulcers, while those with growth factor activity may be used in the treatment of viral, promote cell growth. For example, such polypeptides may be used in cell cultures to promote cell growth. For example, such polypeptides may be used to augment or replace cells damaged by illness, may also be used to augment or replace cells damaged by illness, may also be used in the diagnosis of the above conditions, and in drug creening techniques. The presents a novel human conservation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              2117 TITCIGACACAGACTCITGCTCTTGTCGCCCAGGCTGGAGTGCAACGGCACGATCTCAGC 2058

The present sequence is provided in a specification relating to nucleic acid molecules encoding 32 novel human secreted polypeptides. The nucleic actid molecules and polypeptides may be used in the prevention, diagnosis and treatment of diseases such as immune disorders (e.g. multiple sclerosis, systemic lupus erythematosus and human immuno-deficiency virus (HIV) infections), hyperproliferative disorders (e.g. cancers and caucher's disease), cardiovascular diseases (e.g. cancers and cisorders (e.g. corneal graft neovascularisation and dispetic retinopathy), neurological disorders (e.g. Huntington's chorea, cardiomapathy), neurological disorders (e.g. Huntington's chorea, corneal graft neovascularisation and dispetic retinopathy), neurological disorders (e.g. Huntington's chorea, corneally seases and Parkinson's disease), infectious diseases and/or card molecules may be used to produce the secreted polypeptides. The nucleic also be used as DNA probes in dispositic assays to detect and quantitate corneals may be used as antigens in the production of antibodies and assays to identify modulators of their expression and activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            2094

The nucleic acid molecules and polypeptides may be used in the prevention, diagnosis and molecules and polypeptides may be used in the prevention, diagnosis and treatment of diseases such as immune disorders (e.g. multiple calenosis, systemic lupus erythematosus and human immuno-deficiency virus (HIV) infections), hyperproliferative disorders (e.g. cancers and Gaucher's disease), cardiowascular diseases (e.g. Scimitar syndrome, Chaga's cardiomyopathy and coronary arteriosclerosis), angiogenic retinopathy, neurological disorders (e.g. Huntington's chorea, Alzheimer's disease and Parkinson's diseases), infectious diseases and/or for promoting wound healing, regeneration and/or chemotaxis. The nucleic cald molecules may be used to produce the secreted polypeptides. They may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar nucleic acid sequences in samples. The

AAC7446 to AAC77606 encode the proteins given in AAB40237 to AAB43397, sequences have activities such as: cytostatic; hepatotropic; osteopathic; antiparkinsonian; nootropic; hepatotropic; vulnerary; costeopathic; anticonvulsant; antiarchritic; immunosuppressant; immunosimilant; cardiant; thrombolytic; coagulant; vasotropic; antidiabetic; hypotensive; dermatological; immunosuppressive; antidiabetic; hypotensive; dermatological; immunosuppressive; antidiabetic; hypotensive; antifired and antianaemic. The sequences can be used for determining the presence of or predisposition to, or preventing or treating the presence of or predisposition to, or preventing or treating conditions associated with an ORFX-associated disorder. The proteins and nucleic acids may be used to treat cancers or proteins and nucleic acids may be used to treat cancers or proteins and nucleic acids may be used to treat cancers or proteins and nucleic acids may be used to treat cancers or proteins and nucleic acids may be used to treat cancers or proteins and nucleic acids may be used to treat cancers, profiterative disorders, neurodegenerative disorders, osteoarthritis, hypertension, hypotyrodism, cholesterol ester storage, systemic lupus allergies, aplastic anaemia, burns, wounds, bone and cartilage damage, coagulation; to inhibit thrombosis; and as a contraceptive.
                                                                                                                                                                                                                                                                                           Novel nucleic acids and peptides derived from open reading frame X, useful for treating e.g. cancers, proliferative disorders, neurodegenerative disorders and cardiovascular disease -

-I- CAUTION: ALU REPETITIVE SEQUENCES ARE INTERSPERSED IN HUMAN AND PRIMATE GENOMES WITH AN AVERAGE SPACING OF 4 KB. SOME OF THEM ARE ACTIVELY TRANSCRIEDED BY POLL II. NORMAL TRANSCRIPTS MAY CONTAIN ALU-DERIVED SEQUENCES IN 5' OR 3' UNTRANSLATED REGIONS. HOWEVER, CDNA LIBRARIES ALSO CONTAIN PARTIAL AND/OR REARRANGED CONAS. LIGATED WITH ALU-DERIVED SEQUENCE IN ANY ORIENTATION. ALTHOUGH ALU ELEMENTS (ESPECIALLY SITUATED ON THE COMPLEMENTARY STRAND) HAVE A GREAT POTEMTIAL TO CREATE ADDITIONAL/ALTERNATIVE EXONS, CONSIDERATION SHOULD BE GIVEN TO THE POSSIBILITY THAT THE PRESENCE OF AN ALU IN AN OPEN READING FRAME MAY HAVE RESULTED FROM A CLONING ARTIFACT OR MAY BE DUE TO MISINTERPRETATION OF SEQUENCING DATA. THIS POINT HAS BEEN OVERLOKED ON SEVERAL OCCASIONS, WITH THE OPENSOR OF AN ALU IN AN OPEN OF AN ALU IN ANY AND AND ANY ANY ENERGINED FROM A CLONING ARTIFACT OR MAY BE DUE TO MISINTERPRETATION OF SEQUENCING DATA. THIS POINT HAS BEEN OVERLOKED ON SEVERAL OCCASIONS, WITH ANY DEPENDENCE OF ERRONEOUS ALU-DERIVED AMINO ACID SEQUENCES
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This SWISS-PROT entry is copyright.                                                                                                                                                                                    "Reconstruction and analysis of human Alu genes.";
J. Mol. Evol. 32:105-121(1991).
-!- MISCELLANGOUS: VARIOUS ANALYSES (SEE REF.3 AND REF.4) INDICATE
THAT ALU REPEATS FALL INTO 8 SUBFAMILIES. THEREFORE, 8 ALU WARNING
CONSENSUS SEQUENCES HAVE BEEN CONSTITUTED THAT CONTAIN ALL STX
FRAMES CONCEPTUAL TRANSLATIONS OF EACH OF THESE CLASSES OF ALU
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             CAUTION: ALU REPETITIVE SEQUENCES ARE INTERSPERSED IN HUMAN AND REMATE GENOMES WITH AN AVERAGE SPACING OF 4 KB. SOME OF THEM ARE ACTIVELY TRANSCRIBED BY POL III. NORMAL TRANSCRIPTS MAY CONTAIN ALU-DERIVED SEQUENCES IN 5' OR 3' UNTRANSLATED REGIONS. HOWEVER, CDNA LIBRARIES ALSO CONTAIN PARTIAL AND/OR REARRANGED CDNAS LIGATED WITH ALU-DERIVED SEQUENCE IN ANY ORIENTATION. ALTHOUGH ALU ELEMENTS (ESPECIALLY SITUATED ON THE COMPLEMENTARY STRAND) HAVE A GREAT POTENTIAL TO CREATE ADDITIONAL/ALTERNATIVE EXONS,
                                                                                                                 "Identifying coding exons by similarity search: alu-derived and other potentially misleading protein sequences."; Genomics 12:838-841(1992).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            411 LeuGluCysAsnGlyAlaIleSerAlaHisArgAsnLeuArgLeuProGlySerSerAsp 430
PRIMATE GENOMES WITH AN AVERAGE SPACING OF 4 KB. SOME OF THEM ARE ACTIVELY TRANSCRIBED BY POL III. NORMAL TRANSCRIPTS MAY CONTAIN ALU-DERIVED SEQUENCES IN 5' OR 3' UNTRANSLATED RESIONS. HOWEVER, CDNA LIBRARIES ALSO CONTAIN PARTIAL AND/OR REARRANGED CDNAS LIGATED WITH ALU-DERIVED SEQUENCE IN ANY ORIENTATION. ALTHOUGH ALU GREEMPYS (ESPECIALLY SITUATED ON THE CONFLEMENTARY STRAND) HAVE A CONSIDERATION SHOULD BE GIVEN TO THE POSSIBILITY THAT THE PRESENCE OF AN ALU IN AN OPEN REALING FRAME MAY HAVE RESULTED FROM A CLONING ARTIFACT OR MAY BE DUE TO MISINTERPREPARION OF SEQUENCING DATA. THIS POINT HAS BEEN OVERLOCKED ON SEVERAL OCCASIONS, WITH
                                                                                                                                                                                                                                     CAUTION: ANY SIGNIFICANT SIMILARITY OF A PUTATIVE PROTEIN SEQUENCE WITH AN ALU-TRANSLATED ENTRY MUST BE TAKEN AS A WARNING THAT A PART OF ALU REPEAT MAY HAVE BEEN ARTIFACTUALLY INCLUDED IN THE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           391 ProProArgProAla*******PhePhe***AspGlyValSerLeuLeuLeuProArg
